For my Raspberry Pi-based final project, I am going to install Whatsapp on my Raspberry Pi. After researching other pi projects, I believe that this one can be a genuinely important application. Whatsapp is an application that allows people to communicate around the world for a cost much lower than that of a global phone plan. Being that I am only second generation American, I have many overseas relatives. In addition to this, my grandparents frequently return to their home country of Italy. It is always important in my family that we can contact each other and make sure everything is good and safe. I have chosen this project because I believe this is more valuable to me than a project I will potentially never use again.

Here is the link to my project details:
